

# PYTHON FOR DATA SCIENCE

## UNIT 09

### LISTS

# LIST BASICS

## I. WHAT ARE LISTS?

- Lists are sequences of values
- Values in the list are called elements (or items)
- Lists are “mutable”
  - that means lists can be changed
  - we will find out about tuples in the next section ... tuples are a lot like lists, but they are immutable (i.e. tuples cannot be changed)
- Lists can contain different data types within a single list ... e.g., you can have an integer, a float, a string, and even another list in the same list

# LIST BASICS

## II. HOW LISTS ARE CREATED

- You create lists with a sequence of elements that are enclosed inside of brackets
- list syntax:

```
list_variable = [ list-value/item1, list-value/item2, ... ]
```

# LIST BASICS

## III. EXAMPLES OF LISTS

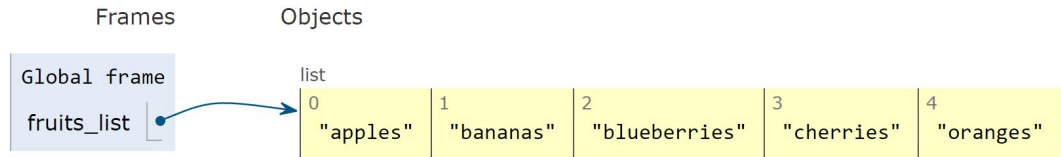

- List of string objects

```
fruits_list = [ 'apples', 'bananas', 'blueberries', 'cherries', 'oranges' ]
```

```
print(type(fruits_list))
```

```
<class 'list'>
```

[Visualize Code Execution](#)

# LIST BASICS

## III. EXAMPLES OF LISTS

- List of integers

```
ints_list = [ 12, 25, 37, 45, 83, 97 ]
```

```
print(type(ints_list))
```

[Visualize Code Execution](#)

```
<class 'list'>
```

Frames

Objects

# LIST BASICS

## IV. EXAMPLES OF LISTS

- List of floats

```
floats_list = [ 6.2, 8.9, 32.41, 76.98 ]
```

```
print(type(floats_list))
```

```
<class 'list'>
```

[Visualize Code Execution](#)

Frames

Objects

Global frame  
floats\_list

list			
0	1	2	3
6.2	8.9	32.41	76.98

# LIST BASICS

## IV. EXAMPLES OF LISTS

- List with several data types

```
mixed_list = [ 43.2 , 18, "cat", [5.1, "dog", 6, "elephant"], 9, "cow"]
```

```
print(type(mixed_list))
```

```
<class 'list'>
```

[Visualize Code Execution](#)

# LIST BASICS

## V. LIST ITEMS HAVE INDEXES

- Each element in a list has an index
- list indexes start at 0 -- just like strings and other sequences

```
States_list = [ 'Minnesota', 'Iowa', 'Wisconsin', 'Illinois', 'Indiana', 'Michigan', 'Ohio' ]
```

index:	0	1	2	3	4	5	6
states_list:	Minnesota	Iowa	Wisconsin	Illinois	Indiana	Michigam	Ohio

# LIST BASICS

## VI. OTHER WAYS TO CREATE LISTS

- You can create lists using the list() function
- list() transforms different structures into lists

```
sports_set = {'football', 'basketball', 'soccer', 'golf', 'tennis', 'baseball'}
```

```
print(type(sports_set))
```

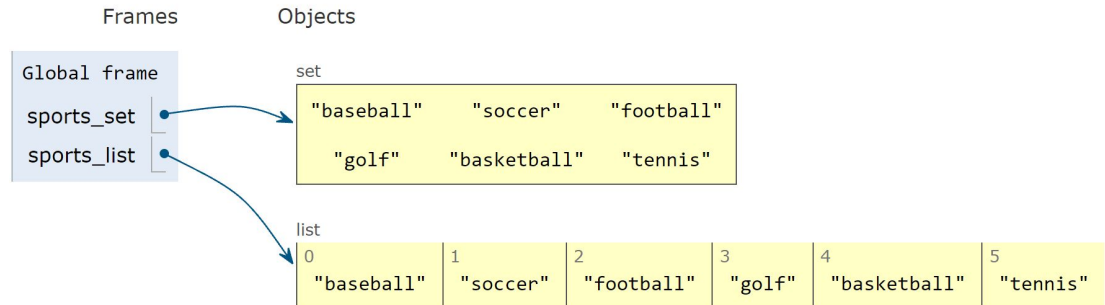

```
sports_list = list(sports_set)
```

```
print(sports_list)
```

```
print(type(sports_list))
```

```
<class 'set'>
['baseball', 'soccer', 'football', 'golf', 'basketball', 'tennis']
<class 'list'>
```

[Visualize Code Execution](#)

# LIST BASICS

## VII. WHY DO WE USE LISTS?

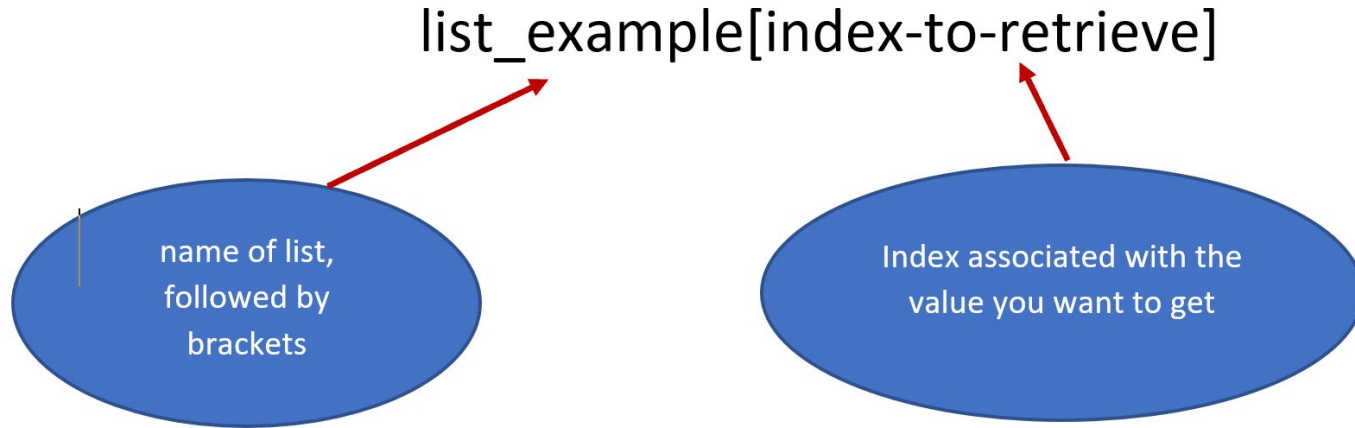

- Lists can change (lists are mutable)
  - this is in contrast to tuples
- You can use lists when you have duplicate items
  - e.g., you have a list of names and two people have the same name
- You can use lists when order matters
  - lists are ordered

# HOW LIST ITEMS ARE RETRIEVED/ACCESSED

## I. LIST ITEMS CAN BE ACCESSED USING “BRACKET NOTATION”

- syntax:

# HOW LIST ITEMS ARE RETRIEVED/ACCESSED

## II. EXAMPLE: HOW TO RETRIEVE ITEMS FROM A LIST

- `colors_list = ["blue", "red", "yellow", "purple", "green", "orange"]`  
`colors_list [ 3 ]`

index:	0	1	2	3	4	5
colors_list:	blue	red	yellow	purple	green	orange

`color_list [ 3 ]` will retrieve the list item purple

# LIST SLICING

## I. YOU CAN ALSO RETRIEVE “SLICES” OF LISTS USING BRACKET NOTATION

- this is very similar to slicing strings
- syntax:

`list_example[start-index : stop-index]`

name of list,  
followed by brackets

The index associated with  
the first list item that you  
want to retrieve.

The index of the “stopping  
point” ... this element will  
not be included.

# LIST SLICING

## II. EXAMPLE: RETRIEVING A SLICE OF A LIST

- `multiples_of_ten = [ 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60 ]`  
`multiples_of_five [ 4 : 8 ]`

				START				STOP				
index:	0	1	2	3	4	5	6	7	8	9	10	11
multiples_of_five:	5	10	15	20	25	30	35	40	45	50	55	60

`multiples_of_five [ 4 : 8 ]` will retrieve the list of items [ 25, 30, 35, 40 ]

# LIST SLICING

## III. EXAMPLE: STOP INDEX ISN'T INCLUDED

- this will retrieve the slice that goes from the start index to the end of the list
- `multiples_of_ten = [ 5, 10, 15, 20, 25, 30, 35, 40, 45, 50, 55, 60 ]`  
`multiples_of_five [ 7 : ]`

index:	0	1	2	3	4	5	6	7	8	9	10	11
multiples_of_five:	5	10	15	20	25	30	35	40	45	50	55	60

START

`multiples_of_five [ 7 : ]` will retrieve the list of items [ 40, 45, 50, 55, 60 ]

# LIST SLICING

We will learn a lot more about slicing lists  
when we get further into this unit!!!!

# LIST METHODS

- Lists also have “list methods”
- List methods can be used to perform operations on lists
  - list methods are called using “dot notation”
  - e.g., `alist.append()`

method	what it does
<code>append()</code>	add an item to end of list
<code>extend()</code>	extends a list with a new list of items
<code>remove()</code>	removes an item from a list
<code>sort()</code>	sorts a list (by value, not by index)
<code>index()</code>	returns the index of the first occurrence of the given

\* note, this is an *abridged* list of list methods

# ADDING ITEMS TO A LIST

- There are two primary ways to add items to a list
  - `append()`
  - `extend()`
- You can also concatenate strings

# ADDING ITEMS TO A LIST

`append()`

ADDS NEW ELEMENTS TO THE END OF A LIST, ONE AT A TIME

- `colors_list = ["blue", "red", "yellow", "purple", "green", "orange"]`  
`colors_list.append("white")`  
`print(colors_list)`

---

`["blue", "red", "yellow", "purple", "green", "orange", "white"]`

[Visualize Code Execution](#) ... see next slide

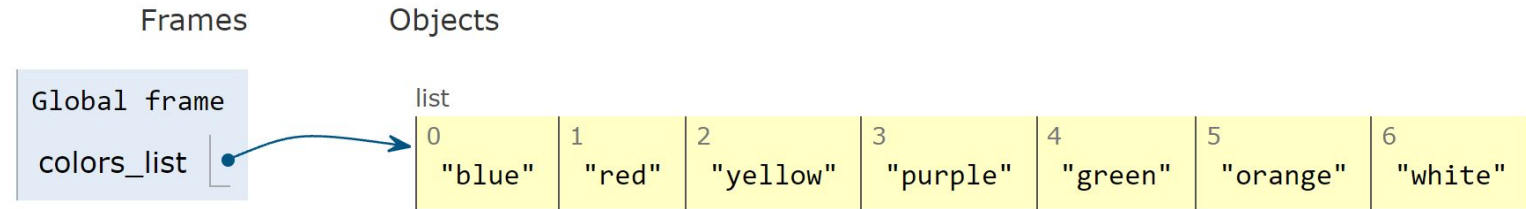

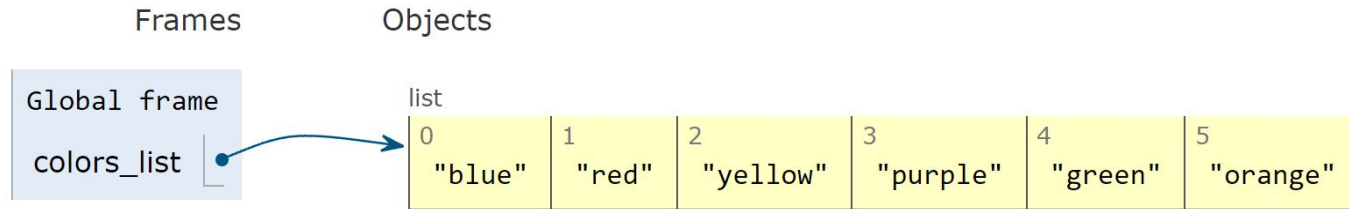

# ADDING ITEMS TO A LIST

```
colors_list = ["blue", "red", "yellow", "purple", "green", "orange"]
```

```
colors_list.append("white")
```

```
print(colors_list)
```

# ADDING ITEMS TO A LIST

`extend()`

ADDS MULTIPLE ELEMENTS TO A LIST

- `sports_list = [ 'football', 'basketball', 'soccer', 'golf', 'tennis', 'baseball' ]`

`extra_sports = [ 'track & field', 'wrestling', 'gymnastics' ]`

`sports_list.extend(extra_sports)`

---

`[ 'football', 'basketball', 'soccer', 'golf', 'tennis', 'baseball', 'track & field', 'wrestling', 'gymnastics' ]`

[Visualize Code Execution](#) ... see next slide

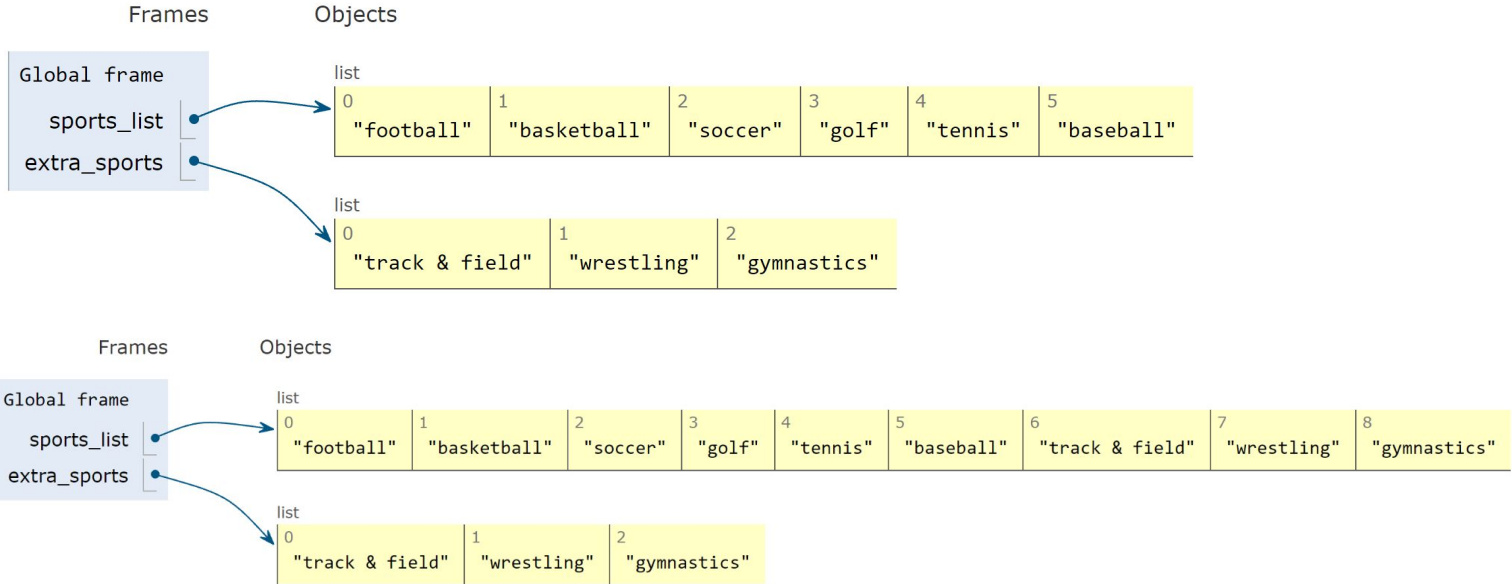

# ADDING ITEMS TO A LIST

```
sports_list = ['football', 'basketball', 'soccer', 'golf', 'tennis', 'baseball']
```

```
extra_sports = ['track & field', 'wrestling', 'gymnastics']
```

```
sports_list.extend(extra_sports)
```

# YOU CAN COMBINE EXISTING LISTS TOGETHER WITH THE + OPERATOR

- this is very similar to string concatenation
- ```
fruits_list1 = [ 'apples', 'oranges', 'cherries' ]
```

```
fruits_list2 = [ 'peaches', 'pears', 'strawberries', 'blueberries' ]
```

```
fruits_list_full = fruits_list1 + fruits_list2
```

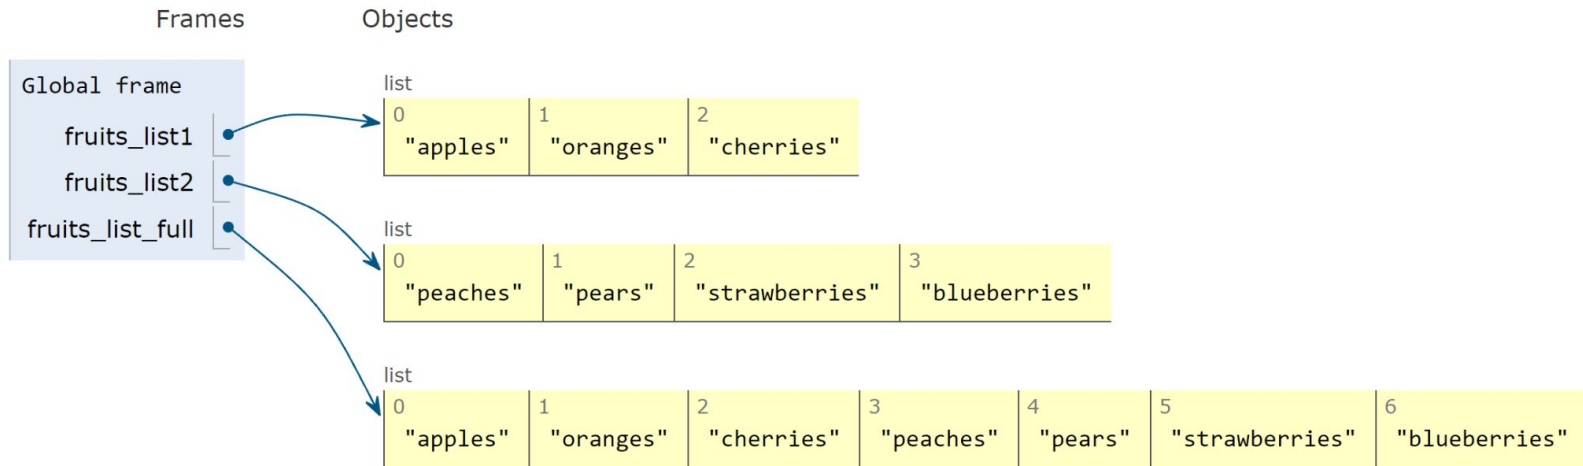

---

```
[ 'apples', 'oranges', 'cherries', 'peaches', 'pears', 'strawberries', 'blueberries' ]
```

[Visualize Code Execution](#) ... see next slide

# YOU CAN COMBINE EXISTING LISTS TOGETHER WITH THE + OPERATOR

# REMOVING ITEMS FROM A LIST

THERE ARE SEVERAL WAYS TO REMOVE ITEMS FROM A LIST

-- del

-- remove

NOTE:

WHEN ITEMS ARE REMOVED FROM A LIST THE REMAINING ITEMS  
SHIFT INDEX POSITION.

## DELETE AN ITEM FROM A LIST USING THE `del` STATEMENT

- Indicate which item to remove by referencing its index
- ```
colors_list = ["blue", "red", "yellow", "purple", "green", "orange"]  
del colors_list[ 4 ]  
print(colors_list)
```

---

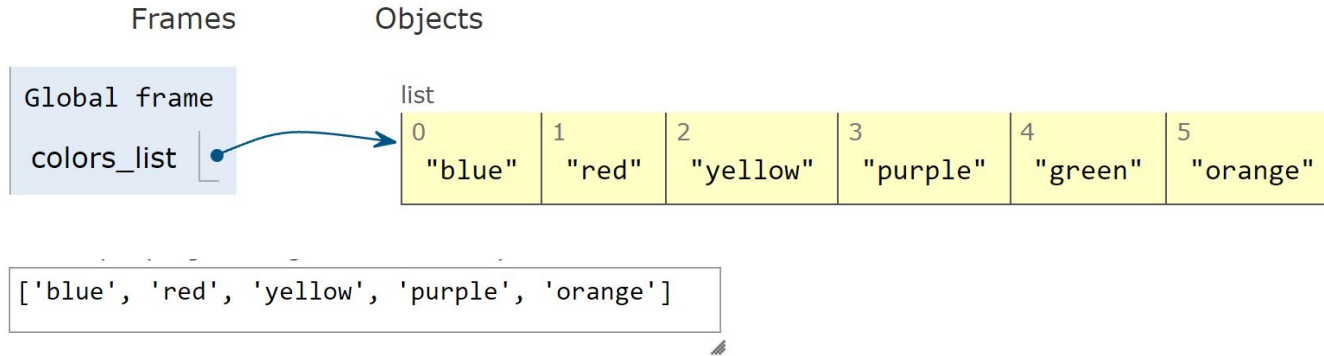

```
["blue", "red", "yellow", "purple", "orange"]
```

[Visualize Code Execution](#) ... see next slide

# DELETE AN ITEM FROM A LIST USING del

```
colors_list = ["blue", "red", "yellow", "purple", "green", "orange"]  
del colors_list[4]  
print(colors_list)
```

# REMOVING AN ITEM FROM A LIST

## USING THE `.remove()` method

- with `.remove()` the item that is to be removed gets referenced
  - the `.remove()` method is useful if you only know the value, not the index
- `animals_list = [ "dog", "cat", "cow", "elephant", "giraffe", "lion" ]`

```
animals_list.remove("giraffe")
```

```
print(animals_list)
```

---

```
[ "dog", "cat", "cow", "elephant", "lion" ]
```

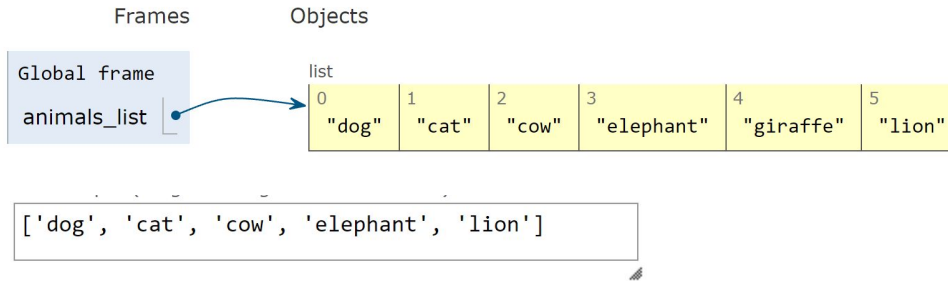

[Visualize Code Execution](#) ... see next slide

# REMOVING AN ITEM FROM A LIST

## USING THE `.remove()` method

```
animals_list = ["dog", "cat", "cow", "elephant", "giraffe", "lion"]  
animals_list.remove("giraffe")  
print(animals_list)
```

REMOVING ITEMS SHIFTS  
INDEX POSITION.
